CHAPTER I

BACKGROUND OF THE PROJECT

Introduction

University of Kristian Evangelion (UKE) Event Registration System is a specialized website created to help school organizers manage their own event sign-ups. In many schools today, organizers rely on "Google Forms" to gather student information. While Google Forms is helpful, it is a third-party tool that can feel unorganized when there are many different events happening at once.

The nature of this Event Registration System is to provide "In-House" solutions. This means we build a system that the university owns and controls. Instead of using a third-party tool, the school will have its own Event Registration Website. This gives the school a better image and makes it much easier to manage student and guest lists in one private database.

Background of the Project

Many schools use Google Forms to register participants for events because it is easy and free. However, Google Forms is mainly designed for collecting responses and does not provide complete tools for managing events. It has limited customization, organization, and long-term data management features.

As schools continue to conduct various activities, there is a need for a system that can properly manage event information, participant records, and registration history in one platform. A customized system can also be adjusted based on the school's needs and policies.

In addition, developing an Event Registration Website helps students improve their skills in web development, database management, and system design. This project aims to create a system that is more organized, flexible, and suitable for long-term use compared to simple online forms.

Statement of Objectives

General Objective

The main goal of this study is to develop a customized web-based registration website that provides a dedicated system for University of Kristian Evangelion (UKE). This project aims to give the school its own platform for posting events and registering participants, so that they no longer have to rely on external tools like Google Forms.

Specific Objectives

1. To create a website that displays school events with necessary details.
2. To design a customizable online registration form for participants.
3. To develop a centralized database for storing registration records.
4. To create an admin dashboard for managing events and participants.
5. To provide better data organization compared to Google Forms.

Scope and Delimitations of the Project

Scope

This study focuses on the development of a web-based Event Registration Website for school use. The system will include:

1. Event posting and viewing
2. Online registration form
3. Participant dashboard
4. Admin management panel
5. Basic reporting system
6. Link-based sharing end point

The website will be accessible through computers and mobile devices with internet connection.

Limitations|Delimitations

The proposed system is limited to basic event registration and management functions. It will not include:

1. Online Payment Processing
2. Mobile Application Version
3. Advanced Data Analytics
4. Integration with External Platforms

The system is intended only for academic and school-related purposes.

Methodology

The Waterfall Model was chosen because it follows a logical, step-by-step process. Each phase must be completed before the next one begins. This is helpful for building a customized system for the school because it ensures that all requirements like replacing Google Forms are fully planned before any coding starts.

Phases of the SDLC

The development of the website was divided into five main stages:

Stage 1: Requirement Analysis

During this phase, the researchers identified the problems with using Google Forms for school events. We listed the features needed for the Event Registration System, such as a central page for event viewing and a dashboard for student information. We also defined the limits of the system, ensuring it stays focused on registration and basic reporting without including features like online payments.

Stage 2: System Design

In the design phase, we created the "blueprint" of the website. We drew the layout of the user interface to make sure it was easy for students to navigate. We also designed the structure of the database, determining how student names, ID numbers, and event choices would be stored and linked together.

Stage 3: Implementation (Coding)

This is the stage where the actual building of the System happened. Using web technologies like HTML, CSS, and PHP, the researchers wrote the code to create the registration forms and the Admin Management Panel. We focused on making sure the website could handle multiple event postings at once.

Stage 4: Testing and Debugging

Once the website was built, it will undergo strict testing. The researchers acted as both "Students" (to test the registration form) and "Admins" (to test the database management). We checked if the information entered in the form correctly appeared in the admin list. Any errors or "bugs" found during this time were fixed immediately.

Stage 5: Deployment and Finalizing

In the final stage, the website was prepared for school use. The researchers checked the website's performance on different browsers to make sure it was stable. This phase marks the transition from a project under development to a working system that the school can use as its own official platform.

Significance of the Project

This study is important because it helps schools become more independent and organized. Instead of using generic tools that everyone else uses, the university will have University of Kristian Evangelion (UKE) a website made specifically for them. This makes the school look more professional and keeps all student data safe in one private place.

The following groups will benefit from this project:

School Administrators - They will benefit the most because they will no longer have to manage many different Google Form links. They will have a single Admin Management Panel where they can see all events and participants in one look. It makes their work faster and more organized.

Event Organizers - Teachers or student leaders who plan events will find it easier to post details and track who is coming. They won't have to manually fix spreadsheets or worry about losing sign-up data, as the website saves everything automatically in the Participant Database.

Students and Participants - Students will have a much better experience. Instead of waiting for a specific link to be sent to them, they can just visit the (UKE) Event Registration Website website to see all upcoming school activities. Registering becomes a simple and familiar process.

The School Institution - The school gains a sense of "digital ownership." Having an in-house system instead of relying on external platforms like Google shows that the school is tech-savvy and cares about the privacy of its students' information.

Future Researchers - This study can serve as a guide for other students who want to build similar systems. It provides a simple foundation for creating school-based tools that solve real-world problems.

Definition of Terms

Admin Management Panel. A control panel or dashboard used by system administrators to manage user accounts, permissions, and site configurations.

In this project, it refers to the private web interface where school staff can create new event posts, view registered students, and manage the central database without needing technical coding skills.

Centralized Database. A data storage system where all information is located, stored, and maintained in a single, unified location for easy access. In this project, it refers to the internal storage system that replaces scattered Google Form spreadsheets, keeping all student registration records in one private school-owned repository.

Event Registration Website. A digital platform designed to facilitate the process of signing up for activities, conferences, or social gatherings. In this project, it refers to the custom "In-House" web application built to serve as the school's official portal for announcing events and collecting participant information.

In-House Solution. A product or service that is developed and operated within an organization rather than by an external provider. In this project, it refers to the school's ownership and control of the Kyusiyu Events system, ensuring that student data remains private and the platform reflects the school's professional image.

University of Kristian Evangelion (UKE) Event Registration System. (System Name). A specific proper noun designating the name of the developed software system. In this project, it is the specific name given to the web application being built to handle school-related event postings and participant registrations.

CHAPTER II

REVIEW OF RELATED LITERATURE, STUDIES AND SYSTEMS

Foreign Literature, Studies and Systems

The global shift toward specialized event technology shows a move away from simple tools like Google Forms toward dedicated systems. According to Getz and Page (2020), the "pre-event phase," which includes registration, is the most important part of an event. They argue that a dedicated website acts as the "digital front door" of a school. When a school uses its own website instead of a third-party form, it builds more trust and looks more professional.

The technical need for these systems is also explained by Aisami (2022), who studied the move from manual forms to automated platforms. His research shows that specialized websites improve data accuracy by reducing human error. This is supported by Westerman et al. (2021), who discuss "Digital Transformation" as the process of moving to "in-house" systems. They found that organizations that own their own systems have better control over their data and can provide a better experience for their users.

Furthermore, dedicated web platforms help school administrators work faster. Richards and Palmer (2023) point out that centralized systems allow admins to manage everything like attendee lists and schedules from a single dashboard. This stops the problem of having too many different links for every event. Finally, Silvers (2021) says that a good system must have a secure "back-end" or admin panel. This ensures that student information is not just collected, but is safely stored in a database for long-term record-keeping.

Local Literature, Studies and Systems

In the Philippines, the move toward digital event management is driven by the need for faster services and better privacy. According to Salisi and Balahadia (2025), many Philippine schools are moving away from manual processes to automated systems to ensure that their records are accurate. Their research suggests that when a school manages its own digital tools, it reduces the workload for staff and prevents student records from being lost. This supports the goal of the Event Registration System, which aims to replace messy Google Form links with one organized website.

The importance of "in-house" systems is also mentioned by Almilla (2024), who studied event systems in local schools. The study found that while free online forms are easy to use, they lack the specific features needed by Filipino teachers, such as a private "Admin Panel" for making reports. Furthermore, Perez and Ramos (2025) explain that "Digital Transformation" in Philippine colleges is now a necessity. They argue that schools must own their own platforms to keep student data private and safe on their own servers.

Finally, the law in the Philippines supports the creation of systems like Event Registration System. Republic Act No. 11032, or the Ease of Doing Business Act, encourages the use of automation to eliminate long queues and slow services. According to Dela Cruz and Santiago (2025), web-based registration systems follow this law by providing a "one-stop-shop" for participants. By building a customized website, schools can provide a faster experience that helps the country's goal of a "Digital Philippines."

Synthesis of the Reviewed Literature, Studies and Systems

The foreign and local studies reviewed both show that moving from manual work to digital systems is necessary for organizations today. Globally, experts like Getz and Page (2020) and Silvers (2021) say that a dedicated registration website acts as the "digital front door" of an event. It makes the school look more professional and builds trust in a way that basic tools cannot. This is supported by Aisami (2022) and Westerman et al. (2021), who explain that having your own system makes sure the data is accurate and gives the school full control over its own information.

In the Philippines, these systems are even more important because the whole country is trying to move toward digital services. Local researchers like Salisi and Balahadia (2025) and Almilla (2024) point out that old methods, like using paper sheets or scattered online forms, often cause delays and mistakes in school records. Also, Perez and Ramos (2025) state that Philippine schools should have their own platforms to keep student information safe and private. Legally, building these automated systems is supported by Republic Act No. 11032, a law that requires faster and better service for everyone (Republic of the Philippines, 2018).

By putting these ideas together, it is clear that Event Registration System solves a major problem. While tools like Google Forms are common, they do not offer the central management and "in-house" ownership mentioned in the studies. Event Registration System follows global standards for efficiency while meeting local laws for automation. By providing a customized Admin Management Panel and a private Participant Database, this project offers a professional and organized choice that ensures school events are managed the right way.

CHAPTER III

COST-BENEFIT ANALYSIS

This section presents the details of the existing system used by the university, including the processes involved and the problems encountered in the current setup.

Existing System Overview

At present, the university uses Google Forms as a form of event registrations. Registration is handled through printed forms, email submissions, or social media messages. All participant information is recorded manually and stored in logbooks or spreadsheet files.

Existing System Processes

- The current registration process follows these steps:
- The participant requests a registration form from the company.
- The staff provides a printed form or sends a soft copy via email or messaging platform.
- The participant fills out the form manually.
- The staff collects the completed form.
- Staff encodes the participant's information into a spreadsheet.
- Payment is verified manually through bank deposit slips or cash records.
- Confirmation is sent manually via text message or email.
- Reports are prepared manually when needed.
- Problems Encountered in the Existing System
- Despite functioning, the current system has several limitations:
- The process is time-consuming due to manual encoding.
- There is a high risk of human error in data entry.
- Paper forms may be lost or damaged.
- Confirmation to participants is often delayed.
- Difficulty in tracking real-time registration counts.
- Reports require manual computation and preparation.
- Data security is limited since files are not centralized.
- Increased workload for staff during peak registration periods.
- This situation results in inefficiency, slower service, and possible dissatisfaction among participants. Because of these issues, there is a need to improve the current system through automation and digitalization.

FEASIBILITY STUDY

Technical Feasibility

The proposed Event Registration Website will be developed using modern web technologies that are accessible and cost-effective. The system will require at least one computer unit or laptop for development and administration purposes. Since the system is web-based, users can access it using any device with an internet connection, such as desktop computers, laptops, tablets, or smartphones.

The software will require a web browser (Google Chrome, Microsoft Edge, or Mozilla Firefox) and a local development environment like XAMPP and MySQL to manage the database. The system will be developed using HTML, CSS, PHP, JavaScript, and MySQL as the backend database. These technologies are widely available and do not require expensive licensing fees.

This will be a database that will hold event details, participation information, and registration details in a centralized database. The hosting of the website can be done through a local server or an online hosting provider, depending on the school's preference. Since the required hardware and software are commonly available in schools, the proposed system is technically feasible.

Operational Feasibility

The proposed Event Registration Website is operationally feasible because it is designed to be user-friendly and easy to manage. Students are able to search and explore available events, complete the online registration form, and send their details without complications. The system is easier to register with than multiple Google Forms or manual tracking of registration.

To the administrators or event managers, posting and editing as well as deleting events can easily be done via the admin dashboard. It also enables monitoring of registered participants and viewing of organized records in one centralized database. This helps to save time, minimize human error, and cut down on paperwork.

Since most students and faculty members are already familiar with using websites and online forms, minimal training will be required. The replacement of Google Forms with a specific system will enhance efficiency and the general management of the event in the school.

Economic Feasibility

The proposed Event Registration Website is economically feasible because it does not require expensive hardware or licensed software. The system will be developed using open-source technologies such as PHP and MySQL, which are free to use.

Most schools already have existing computer units and internet connectivity, so no major additional investment is required. If deployed online, the only possible expense would be web hosting and domain registration, which are affordable annually.

Compared to the manual process and scattered use of online forms, the proposed system reduces administrative workload, paper usage, and time consumption. In the long term, the system helps improve productivity and organization without requiring high operational costs. Therefore, the project is financially practical and sustainable for school implementation.

Cost – Benefit Analysis

An Analysis and Design of **University of Kristian Evangelion (UKE)**

Cost - Benefit Analysis of the Proposed System

Personal Month Salary

Personnel	Number	No. of Working Days	Hrs./day	Rate/day	Salary	Monthly Amount
Event Coordinator	1	20	8 hrs.	626.10	12,522.00	12,522.00
